Concepts, theories and algorithms for computing uniformization metrics using Ricci flow method.

#### Concepts

Riemann Uniformization theorem, uniformization metric, Ricci flow, Fuchsian group

#### Algorithms to be covered

- Computing Euclidean Ricci Flow.
- Computing Hyperbolic Ricci Flow.
- Computing Fuchsian group.
- Computing Teichüller coordinates.

## Universal Covering Space

We can cut along some special curves of a surface and spread the surface on the plane or the disk.

Xianfeng David Gu Uniformization Ricci Flow

## Uniformization

#### Theorem (Poincaré Uniformization Theorem)

Let  $(\Sigma, \mathbf{g})$  be a compact 2-dimensional Riemannian manifold. Then there is a metric  $\tilde{\mathbf{g}} = e^{2u}\mathbf{g}$  conformal to  $\mathbf{g}$  which has constant Gauss curvature.

## **Conformal Metric**

#### Definition

Suppose  $\Sigma$  is a surface with a Riemannian metric,

$$\mathbf{g}=\left(egin{array}{cc} g_{11} & g_{12}\ g_{21} & g_{22} \end{array}
ight)$$

Suppose  $\lambda : \Sigma \to \mathbb{R}$  is a function defined on the surface, then  $e^{2\lambda}\mathbf{g}$  is also a Riemannian metric on  $\Sigma$  and called a conformal metric.  $e^{2\lambda}$  is called the conformal factor.

## Angles are invariant measured by conformal metrics.

#### **Conformal Metrics**

Given a surface  $\Sigma$  with a Riemannian metric **g**, find a function  $u : \Sigma \to \mathbb{R}$ , such that  $e^{2u}$ **g** is one of the followings:

Uniform flat metric

$$ar{k} \equiv 0, orall p \in \Sigma / \partial \Sigma$$
 and  $ar{k}_g \equiv const, orall p \in \partial \Sigma$ 

Oniformization metric

$$ar{K} \equiv \textit{const}, orall p \in \Sigma / \partial \Sigma$$
 and  $ar{k}_g \equiv 0, orall p \in \partial \Sigma$ 

with prescribed curvature

The tool to calculate the above metrics is Ricci flow.

・ 同 ト ・ ヨ ト ・ ヨ ト …

э

#### Definition (Surface Ricci Flow)

A closed surface with a Riemannian metric **g**, the Ricci flow on it is defined as

 $\frac{dg_{ij}}{dt}=-Kg_{ij}.$ 

If the total area of the surface is preserved during the flow, the Ricci flow will converge to a metric such that the Gaussian curvature is constant every where.

・ 同 ト ・ ヨ ト ・ ヨ ト …

э

#### Theorem (Hamilton 1982)

For a closed surface of non-positive Euler characteristic, if the total area of the surface is preserved during the flow, the Ricci flow will converge to a metric such that the Gaussian curvature is constant (equals to  $\bar{K}$ ) every where.

#### Theorem (Chow)

For a closed surface of positive Euler characteristic, if the total area of the surface is preserved during the flow, the Ricci flow will converge to a metric such that the Gaussian curvature is constant (equals to  $\bar{K}$ ) every where.

## Generic Surface Model - Triangular Mesh

- Surfaces are represented as polyhedron triangular meshes.
- Isometric gluing of triangles in  $\mathbb{E}^2$ .
- Isometric gluing of triangles in  $\mathbb{H}^2, \mathbb{S}^2$ .

## **Discrete Metrics**

#### Definition (Discrete Metric)

A Discrete Metric on a triangular mesh is a function defined on the vertices,  $I : E = \{all \ edges\} \rightarrow \mathbb{R}^1$ , satisfies triangular inequality.

A mesh has infinite metrics.

![](_page_13_Picture_4.jpeg)

## **Discrete Metrics**

#### Metric

- Discrete Metric: *I* : *E* = {*all edges*} → ℝ<sup>1</sup>, satisfies triangular inequality.
- Metrics determine curvatures by cosine law.

$$\cos \theta_i = \frac{l_j^2 + l_k^2 - l_i^2}{2l_j l_k}, l \neq j \neq k \neq i$$

![](_page_14_Figure_5.jpeg)

・ 同 ト ・ ヨ ト ・ ヨ ト …

3

#### Theorem (Derivative Cosine Law)

Consider an Euclidean triangle  $\theta_i = \theta_i(l_1, l_2, l_3), i \neq j \neq k \neq i$ , then

$$\frac{1}{\sin \theta_i} \frac{\partial \theta_i}{\partial I_j} = \frac{1}{\sin \theta_j} \frac{\partial \theta_j}{\partial I_i}$$

#### Metric Space

The space of all Euclidean metric on a triangle

$$E(2) = \{(l_1, l_2, l_3) | l_i + l_j > l_k\}$$

#### Energy on metric space

Suppose we have a differential one-form

$$\omega = \sum \log \tan \frac{\theta_i}{2} dl_i,$$

then  $d\omega = 0, \omega$  is a closed one-form,therefore

$$F(l_1, l_2, l_3) = \int_{(1,1,1)}^{(l_1, l_2, l_3)} \omega$$

is a well defined energy on metrics.

< 🗇 > <

프 > 프

#### Convexity of the energy

The derivative is

$$\frac{\partial F}{\partial I_i} = \ln \tan \frac{\theta_i}{2}$$

the Hessian is

$$\frac{\partial^2 F}{\partial I_i \partial I_j} = \left[\frac{1}{\sin \theta_i} \frac{\partial \theta_i}{\partial \theta_j}\right]_{3 \times 3}$$

semi-positive definite. The energy is convex.

・ 戸 ト ・ ヨ ト ・ ヨ ト ・

э

For a triangular mesh ( $\Sigma$ , T, I), where T is the triangulation, I is the metric (edge length), define its energy E(I), the sum of energy of its triangles

$$\boldsymbol{E}(\mathbf{I}) = \sum_{[i,j,k]\in T} \boldsymbol{F}(I_i, I_j, I_k)$$

then

۲

$$\frac{\partial E}{\partial I_i} = \ln \tan \frac{\alpha}{2} \tan \frac{\beta}{2}$$

 $\alpha, \beta$  are opposite to edge  $e_i$ .

▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ …

## Metric Energy on Mesh

Let  $\psi : \{ all edges \} \rightarrow \mathbb{R},$ 

$$\psi(e) = an rac{lpha}{2} an eta 2$$

called edge invariants. Then

$$\nabla E = (In\psi(e_1), In\psi(e_2), \cdots, In\psi(e_n)).$$

#### Theorem

Suppose  $\phi : \Omega \to \mathbb{R}$  is strictly convex, then  $x \to \nabla \phi$  is a one to one map.

#### Theorem (Edge invariants)

A triangular mesh is determined upto isometry and scaling by its edge invariant,  $\psi : \{all edges\} \rightarrow \mathbb{R}$ .

・ ロ と く 雪 と く 雪 と ・

ъ

## **Discrete Curvature**

#### Definition (Discrete Curvature)

Discrete curvature:  $K : V = \{vertices\} \rightarrow \mathbb{R}^1$ .

$$K(\mathbf{v}) = 2\pi - \sum_{i} \alpha_{i}, \mathbf{v} \notin \partial M; K(\mathbf{v}) = \pi - \sum_{i} \alpha_{i}, \mathbf{v} \in \partial M$$

Theorem (Discrete Gauss-Bonnet theorem)

$$\sum_{\mathbf{v}\notin\partial M} \mathbf{K}(\mathbf{v}) + \sum_{\mathbf{v}\in\partial M} \mathbf{K}(\mathbf{v}) = 2\pi\chi(\mathbf{M}).$$

![](_page_20_Picture_6.jpeg)

#### Metrics vs. Curvatures

- All metrics for a mesh  $L(\Sigma)$  form a convex polytope.
- All admissible curvature configurations for a mesh K(Σ) also form a convex polytope.
- The mapping from the metrics to the curvatures

$$\Phi: \boldsymbol{\mathsf{L}}(\Sigma) \to \boldsymbol{\mathsf{K}}(\Sigma),$$

is not one to one.

< 同 > < 回 > < 回 > -

#### Theorem

Given a prescribed curvature function K,  $\phi^{-1}(K)$  is a |E| - |V| dimensional manifold.

#### Theorem (Prescribed Curvature)

The mapping from a conformal class of metrics to the curvatures is a homeomorphism.

## Conformal metric deformation

#### **Conformal maps Properties**

- transform infinitesimal circles to infinitesimal circles.
- preserve the intersection angles among circles.

![](_page_23_Picture_4.jpeg)

#### Idea - Approximate conformal metric deformation

Replace infinitesimal circles by circles with finite radii.

Xianfeng David Gu Uniformization Ricci Flow

イロト 不得 トイヨト イヨト

## **Circle Packing Metric**

#### **CP** Metric

We associate each vertex  $v_i$ with a circle with radius  $\gamma_i$ . On edge  $e_{ij}$ , the two circles intersect at the angle of  $\Phi_{ij}$ . The edge lengths are

$$I_{ij}^2 = \gamma_i^2 + \gamma_j^2 + 2\gamma_i\gamma_j\cos\Phi_{ij}$$

CP Metric  $(\Sigma, \Gamma, \Phi)$ ,  $\Sigma$  triangulation,

$$\boldsymbol{\mathsf{\Gamma}} = \{\gamma_i | \forall \mathbf{v}_i\}, \boldsymbol{\Phi} = \{\phi_{ij} | \forall \mathbf{e}_{ij}\}$$

![](_page_24_Figure_6.jpeg)

イロト イ得ト イヨト イヨト

э

#### Definition (Conformal Circle Packing Metrics)

Two circle packing metrics  $\{\Sigma, \Phi_1, \Gamma_1\}$  and  $\{\Sigma, \Phi_2, \Gamma_2\}$  are conformal equivalent, if

- The radii of circles are different,  $\Gamma_1 \neq \Gamma_2$ .
- The intersection angles are same,  $\Phi_1 \equiv \Phi_2$ .

In practice, the circle radii and intersection angles are optimized to approximate the induced Euclidean metric of the mesh as close as possible.

イロト 不得 とくほ とくほ とう

#### Definition (Discrete Ricci flow)

A mesh  $\Sigma$  with a circle packing metric  $\{\Sigma, \Gamma, \Phi\}$ , where  $\Gamma = \{\gamma_i, v_i \in V\}$  are the vertex radii,  $\Phi = \{\Phi_{ij}, e_{ij} \in E\}$  are the angles associated with each edge, the discrete Ricci flow on  $\Sigma$  is defined as

$$\frac{d\gamma_i}{dt} = (\bar{K}_i - K_i)\gamma_i,$$

where  $\bar{K}_i$  are the target curvatures on vertices. If  $\bar{K}_i \equiv 0$ , the flow with normalized total area leads to a metric with constant Gaussian curvature.

#### Idea

Metric deformation is driven by curvature.

▲ 同 ▶ ▲ 国 ▶ .

#### Theorem (Chow and Luo 2002)

A discrete Euclidean Ricci flow  $\{\Sigma, \Gamma, \Phi\} \rightarrow \{M, \overline{\Gamma}, \Phi\}$  converges.

$$|K_i(t) - \bar{K}_i| < c_1 e^{-c_2 t},$$

and

$$|\gamma_i(t) - \bar{\gamma}_i| < c_1 e^{-c_2 t},$$

where  $c_1, c_2$  are positive numbers.

▲□▶ ▲冊▶ ▲三▶ ▲三▶ 三三 ろのの

#### Definition

Let  $u_i = ln\gamma_i$ , the Ricci energy is defined as

$$f(\mathbf{u}) = \int_{\mathbf{u}_0}^{\mathbf{u}} \sum_{i=1}^{n} (K_i - \bar{K}_i) du_i,$$

where  $\mathbf{u} = (u_1, u_2, \cdots, u_n)$ ,  $\mathbf{u}_0 = (0, 0, \cdots, 0)$ .

▲□▶ ▲□▶ ▲目▶ ▲目▶ 三目 のへで

#### Theorem (Ricci Energy)

Euclidean Ricci energy is Well defined and convex, namely, there exists a unique global minimum.

#### Proof.

In an Euclidean triangle, with angles  $(\theta_1, \theta_2, \theta_3)$  and radius  $(\gamma_1, \gamma_2, \gamma_3)$ , let  $u_i = ln\gamma_i$ , according to Euclidean cosine law,

$$\frac{\partial \theta_i}{\partial u_j} = \frac{\partial \theta_j}{\partial u_i}.$$

Therefore  $\omega = \sum \theta_i du_i$  is a closed 1-form. The Euclidean Ricci energy is well defined. Direct computation verifies that Hessian matrix is positive definite.

・ロト ・ 四ト ・ ヨト ・ ヨト ・

#### Theorem (Ricci Energy)

#### Gradient descent Method

Ricci flow is the gradient descent method for minimizing Ricci energy,

$$\nabla f = (K_1 - \bar{K}_1, K_2 - \bar{K}_2, \cdots, K_n - \bar{K}_n).$$

#### Newton's method

The Hessian matrix of Ricci energy is

$$\frac{\partial^2 f}{\partial u_i \partial u_j} = \frac{\partial K_i}{\partial u_j}.$$

Newton's method can be applied directly.

▲ @ ▶ ▲ 三 ▶ ▲

#### Ricci Flow for Uniform Flat Metric

Suppose  $\Sigma$  is a closed genus one mesh,

- **Or a compute the circle packing metric**  $(\Gamma, \Phi)$ .
- Set the target curvature to be zero for each vertex

$$ar{K}_i \equiv 0, \forall v_i \in V$$

- Minimize the Euclidean Ricci energy using Newton's method to get the target radii r.
- Ompute the target flat metric.

## Algorithm : uniform flat metric for open surfaces

Given a surface  $\Sigma$  with genus g and b boundaries, then it Euler number is

$$\chi(\Sigma)=2-2g-b.$$

Suppose the boundary of  $\Sigma$  is a set of closed curves

$$\partial \Sigma = C_1 \cup C_2 \cup C_3 \cdots C_b.$$

The total curvature for each  $C_i$  is denoted as  $2m_i\pi, m_i \in \mathbb{Z}$ , and  $\sum_{i=1}^{b} m_i = \chi(\Sigma)$ . The target curvature for interior vertices are zeros

![](_page_33_Figure_6.jpeg)

#### Euclidean Ricci flow for open surfaces

- Use Newton's method to minimize the Ricci energy to update the metric.
- Adjust the boundary vertex curvature to be proportional to the ratio between the current lengths of the adjacent edges and the current total length of the boundary component.
- Repeat until the process converges.

・ 「「「」、 ( 「」、 (

#### Embedding

- Determine the planar shape of each triangle using 3 edge lengths.
- Glue all triangles on the plane along their common edges by rigid motions. Because the metric is flat, the gluing process is coherent and results in a planar embedding.

## Universal Covering Space and Deck Transformation

![](_page_55_Picture_1.jpeg)

#### **Universal Cover**

A pair  $(\bar{\Sigma}, \pi)$  is a universal cover of a surface  $\Sigma$ , if

- Surface Σ
   is simply connected.
- Projection π : Σ̄ → Σ is a local homeomorphism.

#### **Deck Transformation**

A transformation  $\phi: \overline{\Sigma} \to \overline{\Sigma}$  is a deck transformation, if

 $\pi = \pi \circ \phi.$ 

A deck transformation maps one period to another.

#### Definition (Funchsian Group)

Suppose  $\Sigma$  is a surface, **g** is its uniformization metric,  $(\bar{\Sigma}, \pi)$  is the universal cover of  $\Sigma$ . **g** is also the uniformization metric of  $\bar{\Sigma}$ . A deck transformation of  $(\bar{\Sigma}, \mathbf{g})$  is a Möbius transformation. All deck transformations form the Fuchsian group of  $\Sigma$ .

Fuchsian group indicates the intrinsic symmetry of the surface.

![](_page_56_Picture_4.jpeg)

#### Challenges

- Intrinsically nonlinear method.
- Intrinsically the conformal factor may be exponential.
- Determine the optimal initial circle packing metric.
- Embed universal cover in the Poincaré disk.

< /⊒ > <

## **Future Directions**

#### Future Works

- Design spline schemes based on real projective geometry.
- Hirearchical approach for Ricci energy optimization.
- Surface classification using Fuchsian group.
- Generalize planar geometric algorithms to surface domains using geometric structures.
- Ricci flow on 3-manifolds.
