Connecting to **cs_secure** using UBUNTU

1. Click the wireless network symbol to display the list of wireless networks. 
   Select **cs_secure**

2. Change the settings on this screen to look like the choices shown below. 
   Your CS department username and password should go in the username and password fields.
3. When the screen below appears click Ignore to continue.

![Image of No Certificate Authority certificate chosen dialog box]

4. A follow up screen letting you know to choose a password for the keyring will appear and you can select any password you’d like at this time. At this point you should have a connection to cs_secure using UBUNTU.

5. If you are not receiving any feedback from the network because something may have been entered incorrectly you can clear the cs_secure properties under System->Preferences->Network Connections. Here you can delete the information you have submitted for the network and re-enter your CS department username and password if needed.
